basalt is the most voluminous of all the igneous rocks extensive field experimental petrographic and geochemical studies of basalt

have provided us with a considerable understanding of igneous petrogenesis plate tectonics and crust mantle interaction and exchange one important aspect of geology that has developed over the last few decades is the study of oceanic basalts the ocean basins cover about two thirds of the earth's surface and are floored by a basement of oceanic basalt that is continuously undergoing generation at spreading centres and destruction at subduction zones a process which throughout geological time is recognized as the principal means of generating new crust the study of oceanic basalts enables us to understand better the generation and recycling of crustal materials including the continental crust and the exchange between oceanic crust and seawater via hydrothermal activity compositional variations displayed by oceanic basalts provide windows into the mantle and the identification of isotopically distinct mantle reservoirs demonstrates that the source of oceanic basalts is heterogeneous and is controlled by convection and reservoir interactions within the mantle

the previously untold story of the zenith trans oceanic the world's most romantic and expensive series of portable radios long a companion of kings presidents transoceanic yachtsmen and world explorers the trans oceanic was also carried into battle by american troops in three wars its great popularity in spite of a very high price can be laid at the feet of several generations of armchair travelers who used the shortwave capabilities of the trans oceanic as a window on the world with access to the zenith corporate archives and their long experience as radio enthusiasts and writers for both the popular and scholarly press professors bryant and cones present the engrossing stories of the development and use of the trans oceanic throughout its forty year life they present a wealth of never before published photographs documents and information concerning these fascinating radios their collection preservation and restoration

some empirical relations between diffusion characteristics are investigated by the use of carefully examined data from dye release experiments in the surface layer of the sea these data cover a time scale of diffusion ranging from 1 hour to 1 month and a length scale from 100 m to 100 km two oceanic diffusion diagrams are prepared one showing horizontal variance versus diffusion time and the other showing apparent diffusivity versus the scale of diffusion the overall behaviors of the horizontal variance and of the apparent diffusivity are evidently different from those which the similarity theory of turbulence deduces however there still remains a possibility that the similarity theory may be valid locally in time or length scale with a variable parameter i.e. the rate of turbulent energy transfer the diagrams provide a practical means to predict the rate of horizontal spread of substance introduced from an instantaneous point source as well as the apparent diffusivity as a function of the size of diffusing patch
