this third volume of problems from the william lowell putnam competition is unlike the
previous two in that it places the problems in the context of important mathematical themes the
authors highlight connections to other problems to the curriculum and to more advanced topics
the best problems contain kernels of sophisticated ideas related to important current research

and yet the problems are accessible to undergraduates the solutions have been compiled from the american mathematical monthly mathematics magazine and past competitors multiple solutions enhance the understanding of the audience explaining techniques that have relevance to more than the problem at hand in addition the book contains suggestions for further reading a hint to each problem separate from the full solution and background information about the competition the book will appeal to students teachers professors and indeed anyone interested in problem solving as a gateway to a deep understanding of mathematics

providing insights ideas and tips for solving real world fabrication problems this guide presents a broad range of methods from different welding specialties and a brief understanding of the nonwelding knowledge nearly all welders must have to advance in their trade

yes this is another calculus book however it fits in a niche between the two predominant types of such texts it could be used as a textbook albeit a streamlined one it contains exposition on each topic with an introduction rationale train of thought and solved examples with accompanying suggested exercises it could be used as a solution guide because it contains full written solutions to each of the hundreds of exercises posed inside but its best position is right in between these two extremes it is best used as a companion to a traditional text or as a refresher with its conversational tone its get right to it content structure and its inclusion of complete solutions to many problems it is a friendly partner for students who are learning calculus either in class or via self study exercises are structured in three sets to force multiple encounters with each topic solved examples in the text are accompanied by you try it problems which are similar to the solved examples the students use these to see if they re ready to move forward then at the end of the section there are practice problems more problems similar to the you try it problems but given all at once finally each section has challenge problems these lean to being equally or a bit more difficult than the others and they allow students to check on what they ve mastered the goal is to keep the students engaged with the text and so the writing style is very informal with attempts at humor along the way the target audience is stem students including those in engineering and meteorology programs

there are many resources on grant writing in science technology and medicine but most do not provide the practical advice needed to write the narratives of grant proposals designed to help

novice and experienced investigators write compelling narratives and acquire research funding this is a detailed guide to the content organisation layout phrasing and scientific argumentation of narratives the authors draw on more than twenty years of research and analysis of grant proposals having worked extensively with investigators at different levels from pre doctoral students to senior scientists they have used this experience to design a framework for scientific writing that you can apply directly to narratives the guidelines and advice offered are applicable across many funding agencies including the nih and nsf featuring many real life examples the book covers a range of topics from organisational alternatives to best practices in grammar and editing overview visuals and working with contributors

system simulation techniques with matlab and simulink comprehensively explains how to use matlab and simulink to perform dynamic systems simulation tasks for engineering and non engineering applications this book begins with covering the fundamentals of matlab programming and applications and the solutions to different mathematical problems in simulation the fundamentals of simulink modelling and simulation are then presented followed by coverage of intermediate level modelling skills and more advanced techniques in simulink modelling and applications finally the modelling and simulation of engineering and non engineering systems are presented the areas covered include electrical electronic systems mechanical systems pharmacokinetic systems video and image processing systems and discrete event systems hardware in the loop simulation and real time application are also discussed key features progressive building of simulation skills using simulink from basics through to advanced levels with illustrations and examples wide coverage of simulation topics of applications from engineering to non engineering systems dedicated chapter on hardware in the loop simulation and real time control end of chapter exercises a companion website hosting a solution manual and powerpoint slides system simulation techniques with matlab and simulink is a suitable textbook for senior undergraduate postgraduate courses covering modelling and simulation and is also an ideal reference for researchers and practitioners in industry
