reproduction of the original the story of the solar system by george f chambers

as a star in the universe the sun is constantly releasing energy over a wide range of time and spatial scales making it difficult to observe energy in space as much as we do on Earth. Solar observations in the solar terrestrial environment are complex because energy emission basically consists of three modes: the solar wind, the magnetosphere, and the ionosphere. The first mode of solar energy is the so-called blackbody radiation. In the early days, the phenomena in each plasma region were studied separately but with the progress of solar electromagnetic emission such as x-rays and gamma rays, we realized the importance of treating the whole chain of processes as an entity because of the strong interactions between various regions within the solar system. The second mode of solar energy emission is the solar wind, which consists of particles having a wide range of energies from less than 1 keV to more than 1 GeV. The third mode of solar energy emission is the solar cosmic rays, which are referred to as the solar wind and solar cosmic rays respectively. The solar terrestrial system on the basis of extensive observations and computer simulations over the past two decades has become possible to analyze higher energy particles which are referred to as the solar wind and solar cosmic rays respectively.
