this book discusses state of the art techniques for ecosystem service valuation of forests rivers wetlands lakes and coastal ecosystems for their sustainable development and management an ecosystem service valuation can be used to address environmental degradation of natural resources numerous natural and man made factors like climate change pollution encroachment and over exploitation have put ecosystems under threat worldwide these ecosystems provide a lot of services to human beings but many of these services are not taken into account in the market prices for products and services and their ecological functions are not economically valued the valuation of these ecosystems services will help to shed light on their sustainable management this book offers a fresh and innovative resource that captures the latest advancements addresses emerging challenges and propels the field forward making it a must have for researchers practitioners and policymakers this book is also useful for stakeholders to achieve united nations sustainable development goals 6 sustainability of water resources and 13 climate action the most relevant target audiences are hydrologists hydrogeologists environmental scientists ecologists biologists and academicians this book can be useful to post graduate students researchers academicians policy makers ngos in these fields it also appeals to professionals in the fields of urban planning agriculture forestry water resources management and environmental policy

the book studies specific aspects of urban planning and environmental management aiming to provide actionable insights and solutions this book opens with an analysis of urban processes and the development of mass housing estates using famagusta cyprus as a case study it highlights how topographical factors influence urban growth and housing patterns providing important implications for infrastructure planning a significant focus is placed on the development of environmentally friendly building materials several chapters explore the use of waste products such as cork in creating sustainable materials green and blue infrastructure also receive

substantial attention the book addresses strategies for integrating these elements into urban environments to combat climate change topics such as the retention capacity of green roofs and the role of vegetation in improving urban air quality underscore the importance of ecological infrastructure in creating resilient cities the book further studies urban climate and pollution analysis presenting advanced methods for monitoring and managing environmental conditions chapters on climate change monitoring air pollution assessment through bryophytes and vocs monitoring provide tools for understanding and addressing urban environmental challenges human centric design is another key theme with discussions on pedestrian comfort and walkability in urban spaces by focusing on outdoor promenades and thermal comfort the book highlights the need for urban designs that enhance the quality of life for residents practical approaches to project management and planning are also covered the book introduces methodologies such as pert cpm and monte carlo simulation techniques for improving project outcomes and developing criteria for climate friendly planning competitions finally the preservation of landscape heritage amidst urban expansion is explored a methodology for creating a landscape catalog in arequipa peru is presented as a way to balance development with the conservation of cultural and natural landscapes

this important new work the first of its kind focuses on the distribution patterns of landscape elements or ecosystems the flows of animals plants energy mineral nutrients and water and the ecological changes in the landscape over time includes over 1 200 references from current ecology geography forestry and wildlife biology literature

a central goal of transportation is the delivery of safe and efficient services with minimal environmental impact in practice though human mobility has flourished while nature has suffered awareness of the environmental impacts of roads is increasing yet information remains scarce for those interested in studying understanding or minimizing the ecological effects of roads and vehicles road ecology addresses that shortcoming by elevating previously localized and fragmented knowledge into a broad and inclusive framework for understanding and developing solutions the book brings together fourteen leading ecologists and transportation experts to articulate state of the science road ecology principles and presents specific examples that demonstrate the application of those principles diverse theories concepts and models in the new field of road ecology are integrated to establish a coherent framework for transportation policy planning and projects topics examined include foundations of road ecology roads vehicles and transportation planning vegetation and roadsides wildlife populations and mitigation water sediment and chemical flows aquatic ecosystems wind noise and atmospheric effects road networks and landscape fragmentation road ecology links ecological theories and concepts with transportation planning engineering and travel behavior with more than 100 illustrations and examples from around the world it is an indispensable and pioneering work for anyone involved with transportation including practitioners and planners in state and province transportation departments federal agencies and nongovernmental organizations the book also opens up an important new research frontier for ecologists

transportation corridors notably roads affect wildlife habitat populations and entire ecosystems considerable effort has been expended to quantify direct effects of roads on wildlife populations and ecological communities and processes much less effort has been expended toward quantifying indirect effects in this report we provide a comprehensive review of road transportation corridor ecology

in particular how this new field of ecology has advanced worldwide further we discuss how research thus far has shaped our understanding and views of the ecological implications of transportation infrastructures and in turn how this has led to the current guidance policies and management options we learned that the impacts of transportation infrastructures are a global issue with the potential to affect a wide variety of taxonomically diverse species and ecosystems because the majority of research to date has focused on the direct and more aesthetic and anthropocentric implications of transportation corridors mainly wildlife vehicle collisions it is a fairly standard practice to incorporate underpasses green bridges i e overpasses fencing and barriers into road corridors to alleviate such impacts few studies however have been able to demonstrate the efficiency of these structures furthermore it is becoming increasingly evident that the indirect implications of transportation infrastructures i e behavioral responses of wildlife individuals to roads may be more pervasive at least from the standpoint of biological diversity understanding how road corridors influence the functional connectivity of landscapes is crucial if we are to effectively manage species of concern with these issues in mind we propose a program of study that addresses the indirect and cumulative implications of transportation infrastructure on species distributions community structure and ecosystem function
