this book deals with boundary value problems for analytic functions with applications to singular integral equations new

and simpler proofs of certain classical results such as the plemelj formula the privalov theorem and the poincar bertrand formula are given nearly one third of this book contains the author s original works most of which have not been published in english before and hence were previously unknown to most readers in the world it consists of 7 chapters together with an appendix chapter i describes the basic knowledge on cauchy type integrals and cauchy principal value integrals chapters ii and iii study respectively fundamental boundary value problems and their applications to singular integral equations for closed contours chapters iv and v discuss the same problems for curves with nodes including open arcs chapter vi deals with similar problems for systems of functions chapter vii is concerned with some miscellaneous problems and the appendix contains some basic results on fredholm integral equations in most sections there are carefully selected sets of exercises some of which supplement the text of the sections answers hints are also given for some of these exercises for graduate students or seniors all the 7 chapters can be used for a full year course while the first 3 chapters may be used for a one semester course

constructive methods developed in the framework of analytic functions effectively extend the use of mathematical constructions both within different branches of mathematics and to other disciplines this monograph presents some constructive methods based primarily on original techniques for boundary value problems both linear and nonlinear from among the many applications to which these methods can apply the authors focus on interesting problems associated with composite materials with a finite number of inclusions how far can one go in the solutions of problems in nonlinear mechanics and physics using the ideas of analytic functions what is the difference between linear and nonlinear cases from the qualitative point of view what kinds of additional techniques should one use in investigating nonlinear problems constructive methods for linear and nonlinear boundary value problems serves to answer these questions and presents many results to westerners for the first time among the most interesting of these is the complete solution of the riemann hilbert problem for multiply connected domains the results offered in constructive methods for linear and nonlinear

boundary value problems are prepared for direct application a historical survey along with background material and an in depth presentation of practical methods make this a self contained volume useful to experts in analytic function theory to non specialists and even to non mathematicians who can apply the methods to their research in mechanics and physics

the purpose of the present book is to solve initial value problems in classes of generalized analytic functions as well as to explain the functional analytic background material in detail from the point of view of the theory of partial differential equations the book is intended to generalize the classical cauchy kovalenskaya theorem whereas the functional analytic background connected with the method of successive approximations and the contraction mapping principle leads to the concept of so called scales of banach spaces 1 the method of successive approximations allows to solve the initial value problem  $du/dt = f(t, u)$   $u(0) = u_0$  where  $u(t)$  is real or vector valued it is well known that this method is also applicable if the function  $u$  belongs to a banach space a completely new situation arises if the right hand side  $f(t, u)$  of the differential equation (0.1) depends on a certain derivative  $du/dt$  of the sought function i.e the differential equation (0.1) is replaced by the more general differential equation  $du/dt = f(t, u, du/dt)$  (0.3) there are differential equations of type (0.3) with smooth right hand sides not possessing any solution to say nothing about the solvability of the initial value problem (0.3) (0.2) assume for instance that the unknown function denoted by  $w$  is complex valued and depends not only on the real variable  $t$  that can be interpreted

as time but also on spacelike variables  $x$  and  $y$  then the differential equation 0
