this book examines the field of parallel database management systems and illustrates the great variety of solutions based on a shared storage or a shared nothing architecture constantly dropping memory prices and the desire to operate with low latency responses on large sets of data paved the way for main memory based parallel database management systems however this area is currently dominated by the shared nothing approach in order to preserve the in memory performance advantage by processing data locally on each server the main argument this book makes is that such an unilateral development will cease due to the combination of the following three trends a today s network technology features remote direct memory access rdma and narrows the performance gap between accessing main memory on a server and of a remote server to and even below a single order of magnitude b modern storage systems scale gracefully are elastic and provide high availability c a modern storage system such as stanford s ram cloud even keeps all data resident in the main memory exploiting these characteristics in the context of a main memory based parallel database management system is desirable the book demonstrates that the advent of rdma enabled network technology makes the creation of a parallel main memory dbms based on a shared storage approach feasible
