this book provides a comprehensive review of a new generation of selective oxidation titanosilicate catalysts with the mww topology ti mww based on the research achievements of the past 12 years it gives an overview of the synthesis structure modification and catalytic properties of ti mww ti mww can readily be prepared by means of direct hydrothermal synthesis with crystallization supporting agents using dual structure directing agents and a dry

gel conversion technique it also can be post synthesized through unique reversible structure transformation and liquid phase isomorphous substitution the structural conversion of ti mww into the materials usable for processing large molecules is summarized taking advantage of the structure diversity of the lamellar precursor of ti mww it can be fully or partially delaminated and undergo interlayer silylation to obtain a novel structure with larger porosity in the selective oxidation alkene epoxidation and ketone aldehyde ammoximation with hydrogen peroxide or organic peroxide as an oxidant the unique catalytic properties of ti mww are described in comparison to conventional titanosilicates such as ts 1 and ti beta

this thesis focuses on the study of phonon polaritons hybrids of infrared light and lattice vibrations in van der waals polar materials particularly strongly anisotropic hyperbolic ones it combines experiments analytical theory and numerical simulations to explore nanoscale optical phenomena that challenge our conventional understanding such as negative reflection anomalous refraction and polariton canalization these studies have paved the way for practical applications in integrated flat optics such as planar lenses and resonators for nanoscale light the thesis also introduces the emerging field of twistoptics aimed at controlling the propagation of light at the nanoscale by stacking slabs of van der waals materials at different rotation angles and introduces innovative approaches to tune polariton properties both passively and actively in addition to providing a solid foundation for future advancements in planar nano optical devices and helping lay the fundamentals of light matter interactions in hyperbolic van der waals materials the thesis s didactic approach makes complex phenomena accessible to a broad audience

in recent years the use of nanosized powders and porous materials has been expected to lead to basic breakthrough solutions in the form of prospective nanomaterial products having high performance and multi functional properties for this reason many industrialised nations have financially supported nanostructured materials development and their use in technical innovation
